

Looking for the perfect indoor flooring for your sports hall or gymnasium...

but confused about which one to choose?

Flooring for multi-use gymnasium and indoor sports venues is expected to meet a variety of performance requirements, including high durability, longevity and resistance. But, with so many factors to consider and a variety of products on the market, choosing the most appropriate indoor flooring can be a confusing and lengthy process.

To help take the hassle out of the process, Bradleys Surfacing Systems has compiled a brief review about the best indoor surfacing products on the market in terms of quality and assurance so you can make an informed decision. Whether you're looking to convert old wooden sports flooring into rubber gym flooring, install line marking for sports such as badminton and basketball or point elastic flooring for multipurpose indoor use, Bradleys has a variety of different indoor flooring surfaces to suit specific requirements.

MULTI-PURPOSE SPORTS HALLS

From a playing perspective, the floor surface can be considered the most important part of any sports facility as it plays an important part in improving player performance, reducing injury and maximising the enjoyment of the sport being played.

Taraflex® indoor vinyl flooring is suited to all sporting levels and users, offering the highest levels of performance, comfort and safety. The flooring is specifically designed for both sporting and non-sporting activities, catering for elite sporting performance and everyday educational life.

Sport M Comfort is the highest performing point elastic floor on the market, providing protection against repeat impact injuries at a level similar to a traditional sprung floor. The flooring gives above a 45% force reduction, offering more than enough protection for the vast majority of players.

Sport M Performance is another indoor sports flooring option providing optimal safety and performance. Available in a wide range of colours and suitable for a variety of applications, **Sport M Performance** offers above a 35% force reduction with good impact protection performance.

The force reduction differentiates **Sport M Comfort** from **Sport M Performance**, so if you're undecided which surface is best for your facility, the application will determine this. Sports such as basketball and tennis require less force reduction, whilst sports such as football require more.

Multi Use 6.2 surfacing is suitable for when sport and non-sport use occur at similar levels, for example a primary school hall where the demands can be an assembly then PE, followed by a parents evening. The flooring also importantly gives above 25% force reduction, meaning that it complies with EN14904; the standard for an indoor sports surface.

GYM FLOORING

Gerflor Powershock 60 is a thick, high impact rubber flooring ideal for free weight and heavy weight areas. Designed to be both functional and hard-wearing, the dense rubber can deal with significant weights falling and also protects the sub floor from undue damage.

PVP's SportsMat offers a versatile gym flooring solution that can be tailored to suit specific needs. The sandwich design allows for extra layers of shock absorbing rubber to be added to suit the level of weight lifting in a specific area, going up to Olympic levels if required. The surface is available in a variety of colours including blue, green, red, yellow, grey and beige.
